OK, i can see that you are very talent ,i love your hard work Hs , you are the spirit of RTM as RTM needs the people who believe it and work hard to understand the concepts behind , believe that no one can stop you in every thing that you want to be .
so i want to share with you what i was talking about a while ago , this is just what i found out in the charts a lot of times . so please act with it as a investigation not as rule , the rules always makes sense when we make them our selves. so hope you can make this your self.

"Reversal ENG and continuation ENG."

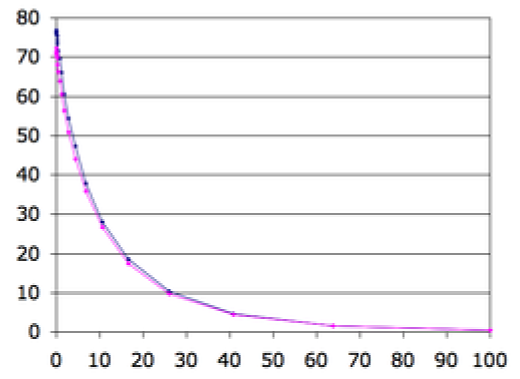

A while ago I thought about this matter that why some times after ENG of a FL in some cases we have another FL to be created and in other cases we see a deep RT to absorb more power and then price go in to the direction of Engulf. If we can understand this then we sure can trade the RT also .we know that in the second case (the RT) we also have another box in opposite direction will be created that we know them as the limit of new transactions of orders.
In the two diagrams below I drew two cases after ENG that happen in the charts.

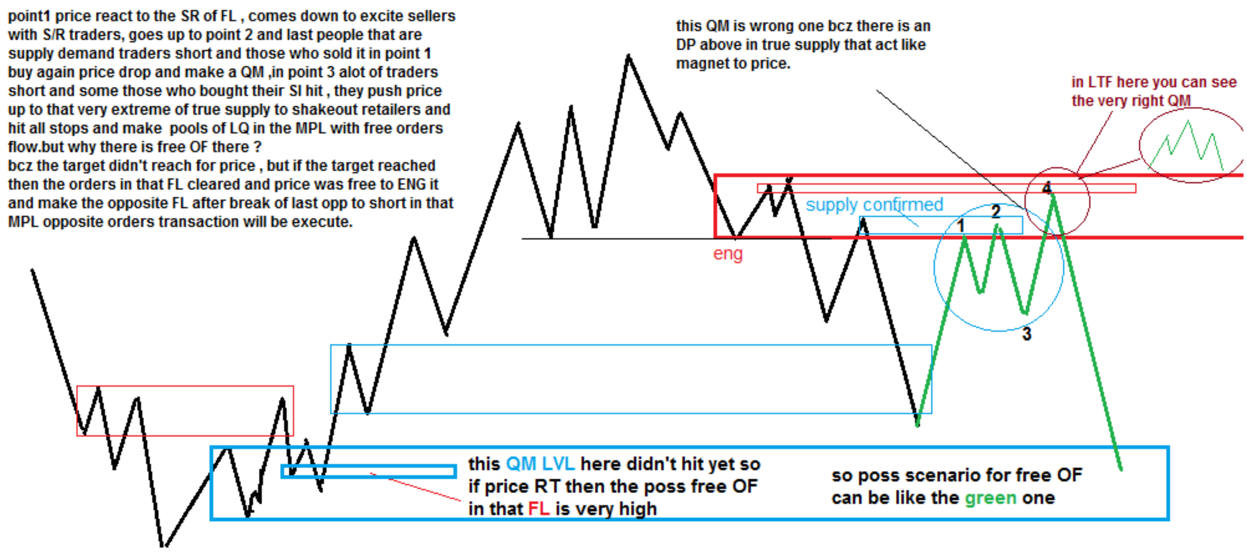

Hope you guys understood my question according to this issue.

Now I want to write an article that is the result of investigating the charts for handerds hours.
I want to use two stories to prove the result in this article; one is the basic ART OF WAR in the entire world and second is the electromagnetic stuff.
First I start with the magnetism of targets and it's relationship with power electrical engineering. There is a Theory in electromagnetic that, the attraction between magnets is a little stronger than the repulsion. That is due to the alignment of the molecular magnets in the magnet.
The attraction as well as the repulsion of magnets decreases significantly with increasing distance. The attraction (blue) of a magnet is slightly stronger than the repulsion (pink) .

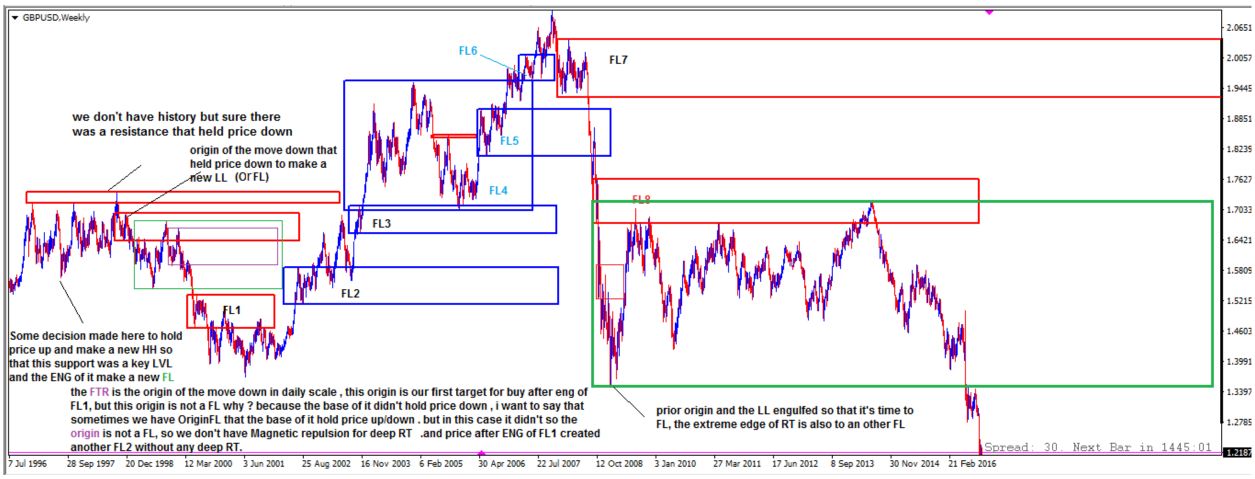

And how do I want to use this information in financial markets in terms of FL AND OF? We know that after engulfing a FL price is likely to reach the target, our target is another FL . I emphasis that FL has two confirmation rules:
1. FL is a kind of FTR that hold price up or down, this is what we talked about significant S/R to be break and the FTR after that is important for us as the entry point or the target , instead of using a lot of S/R in the chart we use the FTR that held price up or down , it's more easy to spot it in this way .as this is the real concepts behind OF , that some transaction of orders create to hold price and after consuption of these orders new transaction execute.
2. FL is a kind of FTR that create after ENG of another FL. again it's about the OF and the new transaction of orders with Free Order Flow(FOF)

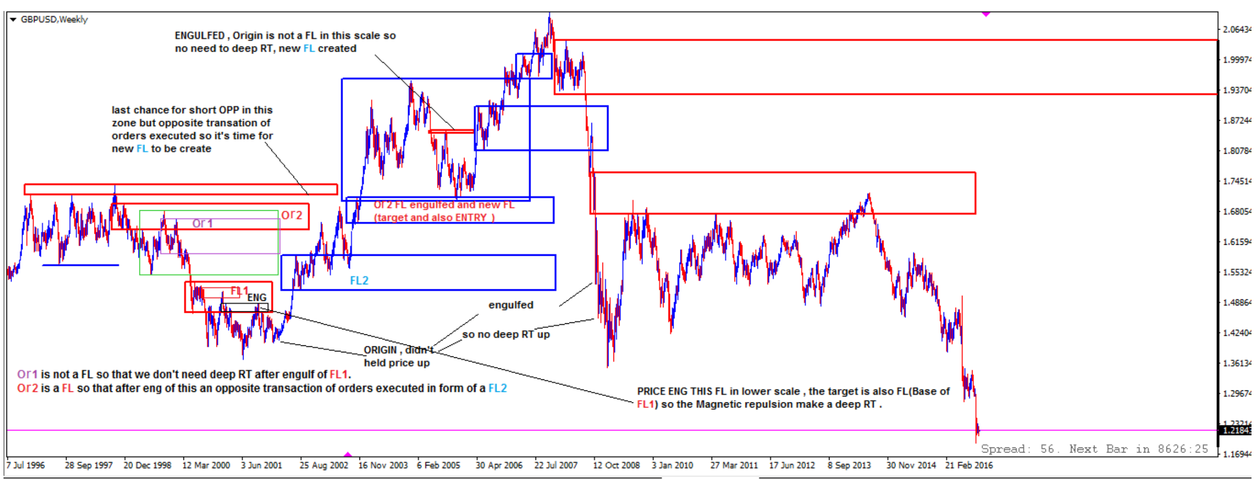

we know that the only true supply/demand is FL and in this zones we expect free order flow and after ENG of one FL the opposite transaction of orders execute with free order flow on the direction of ENG .this free OF always depends on the situation that price reacted after ENG, I mean that we must know where price did come from (target reached or not?)? .
look at this diagram :

Generally we have two kinds of targets for our entry:
1-origin of the move.
2- FL.
Sometimes these two targets are the same; I mean that sometimes origin is a FL itself (that held price up/down and an FTR that engulfed another FL) When our target after ENG of one FL is the origin (The Origin that is also a FL) then we have deep RT to grab some more orders. But in fact it has a reason in terms of Order Flow and also electromagnetic science.
The reason is this:
FL is a true supply/demand and this zone is full of orders to be absorbed and also these orders have Magnetic repulsion. But why?
Now it's time to answer this question by two reasons:
Imagine a war between two countries. For example USA and IRAQ in 2003, if USA army wanted to control IRAQ then it has to pull it's Flag down and raise a new Flag. The market is also a war between 2 groups, buyers and sellers. In this war reaching the important targets(origin that is also a FL) needs a refresh in power of attackers (RT). I believe that all wars have private maps and every maps have significant target, other movements are just playing with hope and fear of attackers. And here we also have the same story. when your target is the origin and the origin is also a FL then price needs more power to overcoming the Magnetic repulsion of the castles (target, enemy think tank) ,I call this magnetic repulsion, RT , this is the reaction of our specific target but always the magnetic attraction is more than the magnetic repulsion if price came from a true zone below or above .but when our target is just an origin (and this origin is not a FL (with those rules)) then after the ENG of a FL price has enough power to reach the target and they don't need more orders to garb and this is again the magnetic attraction and an FTB to new created FL is enough for reaching price to it's target . That's why we put weight on FLs and ENG of FLs.FLs represents the power of price and the power of nations.
These targets very often contains MPLs, when our MPL don't reach this is another sign that price must reach to that MPLs because these LVLs at first (before price reach them) act as Magnetic repulsion but then they act as Magnetic attraction.
Some extra points in FLs:

1- When our origin is a FL also that hold price then very often after ENG of that ORIGIN FL price create an opposite FL and this FL will be our target in future and also in very often our entry point too .
2- When our FL created, price very often react to the S/R line of it to confirm S/D and then FOed to the very extreme of the zone to shakeout retailers.
3- It's important to know when price Flag, very often the very extreme edge of RT is also reacted to and other FL to make a bigger transaction of orders limit.

p.s :
This article is just the result of investigation of the charts and it can be wrong .just wanted to share my understanding .
Thanks RTM
